Education

University of Colorado Boulder, *MS in Computer Science*

Aug 2023 – May 2025

GPA: 3.91/4.0 | Relevant courses: Foundations of Software Engineering, Database Systems, User Centered Design & Development, Machine Learning, Neural Networks and Deep Learning, Natural Language Processing.

SRM Institute of Science & Technology, *B.TECH In Computer Science & Engineering*

Jun 2019 – May 2023

GPA: 9.29/10.0 | Relevant courses: Data Structures & Algorithms, Design & Analysis of Algorithms, Distributed Systems, Object Oriented Design & Programming, Probability & Queueing Theory, Operating systems.

Technical Skills

Programming Languages: Python, Ruby, JavaScript, TypeScript, C/C++, GO, PHP, HTML, CSS.

Frameworks & Database: Flask, FastAPI, Rails, Node.js, Express, Next.js, React, MySQL, Postgres, MongoDB.

DevOps: AWS, Azure, GCP, Git, CI/CD, Jenkins, Docker, Kubernetes, Kafka, Prometheus, Terraform, Grafana.

Data Analysis & ML: TensorFlow, Keras, Pandas, NumPy, PyTorch, scikit-learn, RAG, LLMs, Gen-AI.

Work Experience

Full Stack Developer | **Rattlesnake Ramble Charity Trail Race** | Boulder, CO

Aug 2025 – Present

- Built a secure callback authorization scheme for PayPal confirmations after discovering unauthenticated callbacks were blocked by user auth and implementing an exception policy that exempts callbacks while preserving access control elsewhere, resolving 15+ unrecorded registrations per race event.
- Developed automated email notifications for 100+ registrants by building a Gmail SMTP service that sends payment confirmation emails on successful entries and reminder emails a week and a day before each race.
- Re-architected payment checkout from a stateless PayPal redirect to a server-side Orders API v2 integration, expanding to 4 payment options via the PayPal JS SDK, including Venmo, card, and Pay Later.

Software Development Intern | **Biocollate** | Boulder, CO

Aug 2024 – May 2025

- Engineered a 3-tier access control system (private, org, public) for component data, where changing a component's access level first checks whether other components reference it. The system blocks downgrades that would leave a public or org-level component depending on data it can no longer access.
- Built the protocol design interface in React using drag-and-drop (react-dnd), letting researchers visually compose lab protocols from reusable components instead of writing structured data by hand, and connected it to the backend through a typed API integration layer handling authentication and component data.
- Designed 8 REST API endpoints in Flask powering a bidirectional SBOL3-to-JSON conversion layer, supporting 9 nested biological data types (Component, Sequence, Interaction, Constraint, and others) so researchers could create, retrieve, and manage structured lab protocols, validated by 5 real lab researchers using the platform.

Software Development Intern | **ITJobxs** | Remote

May 2024 – Aug 2024

- Eliminated 20-50 fake bot registrations per day by designing a hashmap-based email domain validation check at registration, replacing a manual delete query previously run to remove fake accounts after the fact.
- Reinforced bot prevention by integrating Google reCAPTCHA into the registration flow, adding a human-verification check that worked regardless of which email domain a bot used to sign up.
- Designed and built a responsive interview experiences listing page from scratch, using custom CSS media queries and Bootstrap's grid system to ensure consistent layout across desktop and mobile screen sizes.

Projects

RecipeRealm Web Application - GitHub | Website

Jan 2024 – May 2024

- Launched RecipeRealm, a full-stack recipe sharing platform using React, Node.js, Express.js, and MongoDB, with secure authentication, recipe CRUD, image uploads, and social engagement features.
- Developed RESTful APIs and MongoDB/Mongoose schemas for recipe and user workflows, and containerized the backend with Docker to support modular deployment and maintainable full-stack development.

AI Generated Text Detection using NLP - GitHub

Aug 2023 – Dec 2023

- Built a machine-generated text detection pipeline using BERT, DistilBERT, and GPT-2 to classify human-written vs AI-generated English text across mixed-domain sources.
- Architected data preprocessing, tokenization, and evaluation pipelines using PyTorch and scikit-learn, and the Hugging Face Transformers, training on 40K balanced text samples for machine-generated text classification.
